

Whether you are looking for individual components for your existing plants or for complete new units to cover increased energy demand – we can support you, delivering valuable and long-lasting solutions for your needs. Second-hand, high-quality equipment can lead to significant cost savings. In the event of damage to existing thermal power plant systems, replacement by used components can avoid long shutdowns, as delivery times for new spare parts are long.

Using our technical expertise, we evaluate the existing assets and match your needs with the best suited quality equipment available. Such an approach can also extend the service life of your generating asset, be it a plant or a unit, at significantly lower capital expenditure.

Our services for buyers at a glance:

- Support for your investment projects
 - Pre-feasibility studies
 - Feasibility studies related to energy markets and technology
 - Commercial feasibility studies including fully-fledged business cases
 - Assistance in warranty solutions
 - Financial consulting
